# SUMMARY

"Rescuezilla Live" and "Clonezilla" are both "Free and Open Source".

"Macrium Reflect Home" and other not-free "apps" for cloning and image backups are not free.

Unlike "Rescuezilla Live" and "Clonezilla", "Macrium Reflect Home" and other non-free apps do not clone the "signature" of a source drive and hence they do not cause "signature conflicts" for "Windows.." computers.

# MACRIUM REFLECT HOME (continued)

..provides a 30-day free trial.

This "Windows.." app prevents signature clashes and Windows.. failures by NOT modifying the GUID Partition Table's "Signature", the EFI System Partition's BCD ("Boot Configure Data" Store), and the C: partition so that the original "Signature" of the target drive is retained.

# MACRIUM REFLECT HOME (continued)

The result is that no signature conflicts occur between the target drives for both bootable drives and data-only drives in Windows.. computers because the "Signature" of a source drive is NOT copied to the target cloned drive.

When you use "Macrium Reflect Home" to clone a bootable Windows drive, it does some cleanup on the target drive at the end of the clone process:
