SUMMARY

Most modern home routers will have an initial default configuration that will work with your Internet supplier's "point of presence" deviceand your existing computers, tablets, cell phones, and printers.

TOPICS

- "Point of presence" devices provided by Internet providers
- Types of routers
- Adding more wired "Ethernet" ports to an existing router
- Adding Category wiring to an existing router
- Adding "Powerline Networking" to an existing router
- Increasing the wireless Wi-Fi coverage of an existing router

TYPES OF ROUTERS

- Most routers are "tri-band"
- Two types of "tri-band routers:
 - 2.5 Gigahertz RF band
 - + low-band 5 Gigahertz RF band
 - + high-band 5 Gigahertz RF band

AND

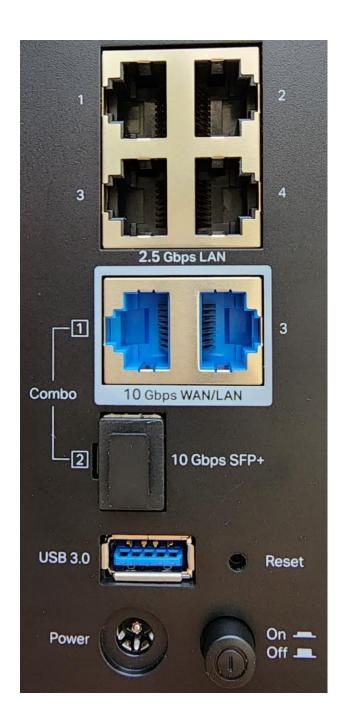

- 2.5 Gigahertz RF band
- + 5 Gigahertz RF band
- + 6 Gigahertz RF band

TYPES OF ROUTERS

- Some high-end routers are "quad-band": 2.5 Gigahertz RF band
 - + low-band 5 Gigahertz RF band
 - + high-band 5 Gigahertz RF band
 - + 6 Gigahertz RF band

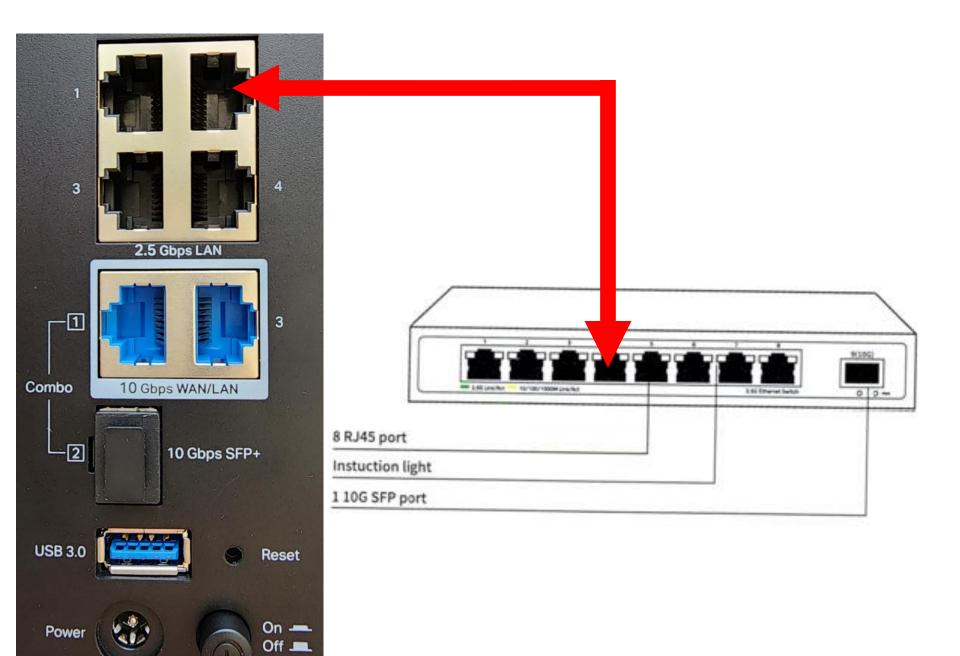

PARTS OF A TYPICAL ROUTER

- 1. Internet port = "Wide Area Network" port
- 2. "Local Area Network" 1 or 2.5 Gbps Ethernet ports
- 3. 2.5 Gigahertz RF transmitter-receiver and one or more antennas
- 4. Low-band 5 Gigahertz RF transmitterreceiver and one or more antennas
- 5. High-band 5 Gigahertz RF transmitterreceiver and one or more antennas
- 6. 6 Gigahertz RF transmitter-receiver and one or more antennas

ADDING MORE WIRED ETHERNET "LOCAL AREA NETWORK" PORTS TO AN EXISTING ROUTER

Attach a Gigabit or multi-Gigabit
"Local Area Network" switch device
to one of the ports on the Local Area
Network part of the existing router.

MODIFYING THE CONFIGURATION OF THE ROUTER

If you wish to modify the configuration of the router, you can follow the steps in the user manual of the router but here are some additional hints to make sure that you are successful:

 Prior to modifying the configuration of the router, (temporarily) disable any network adapters that are not being used to connect your computer to the router by going to "Network Connections" in the "Windows.." control panel or in Mac "OS X" "System Preferences"

 Make sure that one and only one of the network adapters in your computer is connected either wired or wirelessly to the "Local Area Network" side of the router.

- Start a Web browser in your computer
- Type in the router-specific URL address that was provided in the users manual of the router. For an "Edimax" router, you would type in http://edimax.setup

 If the router's configuration Web page is displayed in your Web browser, enter in the default username and password that is provided either in a sticker on the router or in the user manual of the router

If the router's configuration Web page is not displayed in your Web browser, open an elevated "Administrator" command prompt window in "Windows..." or a terminal window in Applications/Utilities in a Mac

OF THE ROUTER (continued)In the command prompt window, type in ipconfig in "Windows.." or

ifconfig in a Mac

Then hit the enter key on your keyboard

- Look for the information listing of the network adapter that you connected to the router
- In the information listing of the network adapter that you connected to the router, look for the "Default Gateway" IP address

C:\WINDOWS\system32>ipconfig

```
C:\WINDOWS\system32>ipconfig
Windows IP Configuration
Wireless LAN adapter Local Area Connection* 5:
  Media State . . . . . . . . : Media disconnected Connection-specific DNS Suffix . :
Ethernet adapter Ethernet:
  Connection-specific DNS Suffix .:
  IPv6 Address. . . . . . . . . . . . . 2606:6000:f507:ed00:f505:636b:c9ce:bbaa
  Temporary IPv6 Address. . . . . : 2606:6000:f507:ed00:a542:991a:9d41:cdc5
  Link-local IPv6 Address . . . . : fe80::f505:636b:c9ce:bbaa%4
  IPv4 Address. . . . . . . . . : 192.168.0.12
  Default Gateway . . . . . . . : fe80::16cf:e2ff:fea1:c8d7%4
                                   192.168.0.1
Wireless LAN adapter Wi-Fi:
  Connection-specific DNS Suffix . : Belkin
  IPv4 Address. . . . . . . . . : 10.0.0.3
  Default Gateway . . . . . . . . : 10.0.0.1
```

Wireless LAN adapter <u>Wi-Fi:</u>

Connection-specific DNS Suffix . : Belkin

IPv4 Address. : 10.0.0.3

Default Gateway : 10.0.0.1

Go back to your Web browser and go to the address of the default gateway by typing the following into the address field of the address bar: http://xxx.xxx.xxx where xxx.xxx.xxx.xxx is the default gateway address

USB PORTS ON ROUTERS

 Many models of routers have one or more USB ports.

These USB ports could have one of three functions:

USB PORTS ON ROUTERS (continued)

- Possible USB port functions:
 - 1. No function or a possible future function when a future firmware upgrade is released.
 - 2. Connects one end-user computer to the local area network (LAN) side of the router (if a specific, provided "driver" is installed

USB PORTS ON ROUTERS (continued)

- Possible USB port functions (continued)
 - 3. You can insert a external hard drive or a USB thumb drive which the router then shares on the local area network (LAN) side of the router as "Network Attached Storage" (NAS).

USB PORTS ON ROUTERS (continued)

If you discover one or more USB ports on a specific model of router, you will have to look at the manufacturer's online, paper, and CD-based documentation to determined what you can do with the USB port.

"NETWORK ATTACHED STORAGE" (NAS)

- Some routers have "Networkattached Storage" inside them
- Some routers provide "Networkattached Storage" when you insert a flash drive device into their USB port

"NETWORK ATTACHED STORAGE" (NAS) (continued)

Go to \\xxx.xxx.xxx/ where xxx.xxx.xxx.xxx is the IP address of the router (= the default gateway address) You have to use two left-leaning slashes.

"NETWORK ATTACHED STORAGE" (NAS) (continued)

Example:
