This product provides a way to charge:

1. A laptop
2. A tablet
3. A smart phone
4. A camera
5. Any other device that needs it

You can charge all of these at once, if you need to. There are five USB 3.0 ports, one of which is a USB-C.

The unit provides up to 80 watts of power across the five ports. It can fast charge the newest iPhone, using the USB-C port and an Apple USB-C to lightning cable.

The laptop charging capability depends on having the proper connector to the laptop. This product does not include any such connectors, but an extensive list of 35 connectors is available. While this list may not cover every laptop that exists, it will work for most common makes.

The unit is compact, measuring 4.5" by 3.75" and includes a Quick Start Guide, a USB-C to USB-C cable and a wall plug cord for charging the device. The guide does not state how long a full charge for the unit takes.

The Guide shows a list of 35 connectors with the voltage output and the make of laptop for which it applies. Some laptops use the same connector for any of the models by a manufacturer, but for others, the connector differs by model.

This product is unique, as far as I know. I know of no other such product that allows USB-C charging and no other product that can charge as many devices as this one.
