December 31, 2022

There have been quite a few types of automated sweepers introduced in the past few years. LG's "Cordzero A9 Kompressor" with Steam Power Mop is new and one of a kind.

"Cordzero.." not only mops but also uses steam to enhance cleaning results. The mop itself is kept at about 60 degrees F so as to remove stains from flooring more easily than conventional mopping tools. No detergent is used in the mopping operation.

The steam nozzles come with embedded sensors to keep the mop from overheating. When the tool is elevated for about 20 seconds the steam supply is shut off.

The device comes with a docking station which stores, recharges and automatically empties the vacuum. What a great feature that is!

Powerful suction is supplied to get stubborn dust and debris from the floor.

The docking station includes a replaceable dust bag, an automated emptying system, and a display that gives status updates.

This is a most unusual and useful appliance. It will be demonstrated at CES 2023, along with the many other LG appliances.
